Summary

Detail-oriented customer service professional transitioning into project management, bringing 3+ years of experience in client communication, scheduling, and conflict resolution. Certified in Agile fundamentals and skilled in tools like Trello and Asana. Looking to contribute organizational expertise to a dynamic project team.

Project:

Online Student BusPass Management System

- 1. Project Overview & Objective

The Online Student Bus Pass Management System is a web-based application designed to automate the process of issuing, renewing, and managing student bus passes. It replaces traditional, slow, paper-based manual systems where students have to stand in long queues at transport counters. The system allows students to apply for passes online, enables administrators to verify details and approve or reject applications, and generates digital/printable passes.

- 2. Proposed System Modules

The project is typically divided into two core panels:

- A. Student / User Module

Registration & Login: Students can create an account and log in securely.

Bus Pass Application: Fill out a form with personal details, upload a passport-size photo, and select travel routes (Source to Destination).

Status Check: Track whether the pass application is Pending, Approved, or Rejected.

Pass Download / Printing: Once approved, students can view and print their digital bus pass containing a unique pass ID.

Renewal Request: Apply for pass extension (monthly/quarterly) online.

- B. Admin Module

Dashboard: Overview of total users, pending applications, approved passes, and daily registrations.

Route & Fare Management: Add, update, or delete bus routes, source/destination points, and pricing.

User Verification: Review student details (such as institution name and ID proof) and approve/reject pass requests.

Report Generation: Generate custom reports based on date ranges, active pass holders, or revenue.
